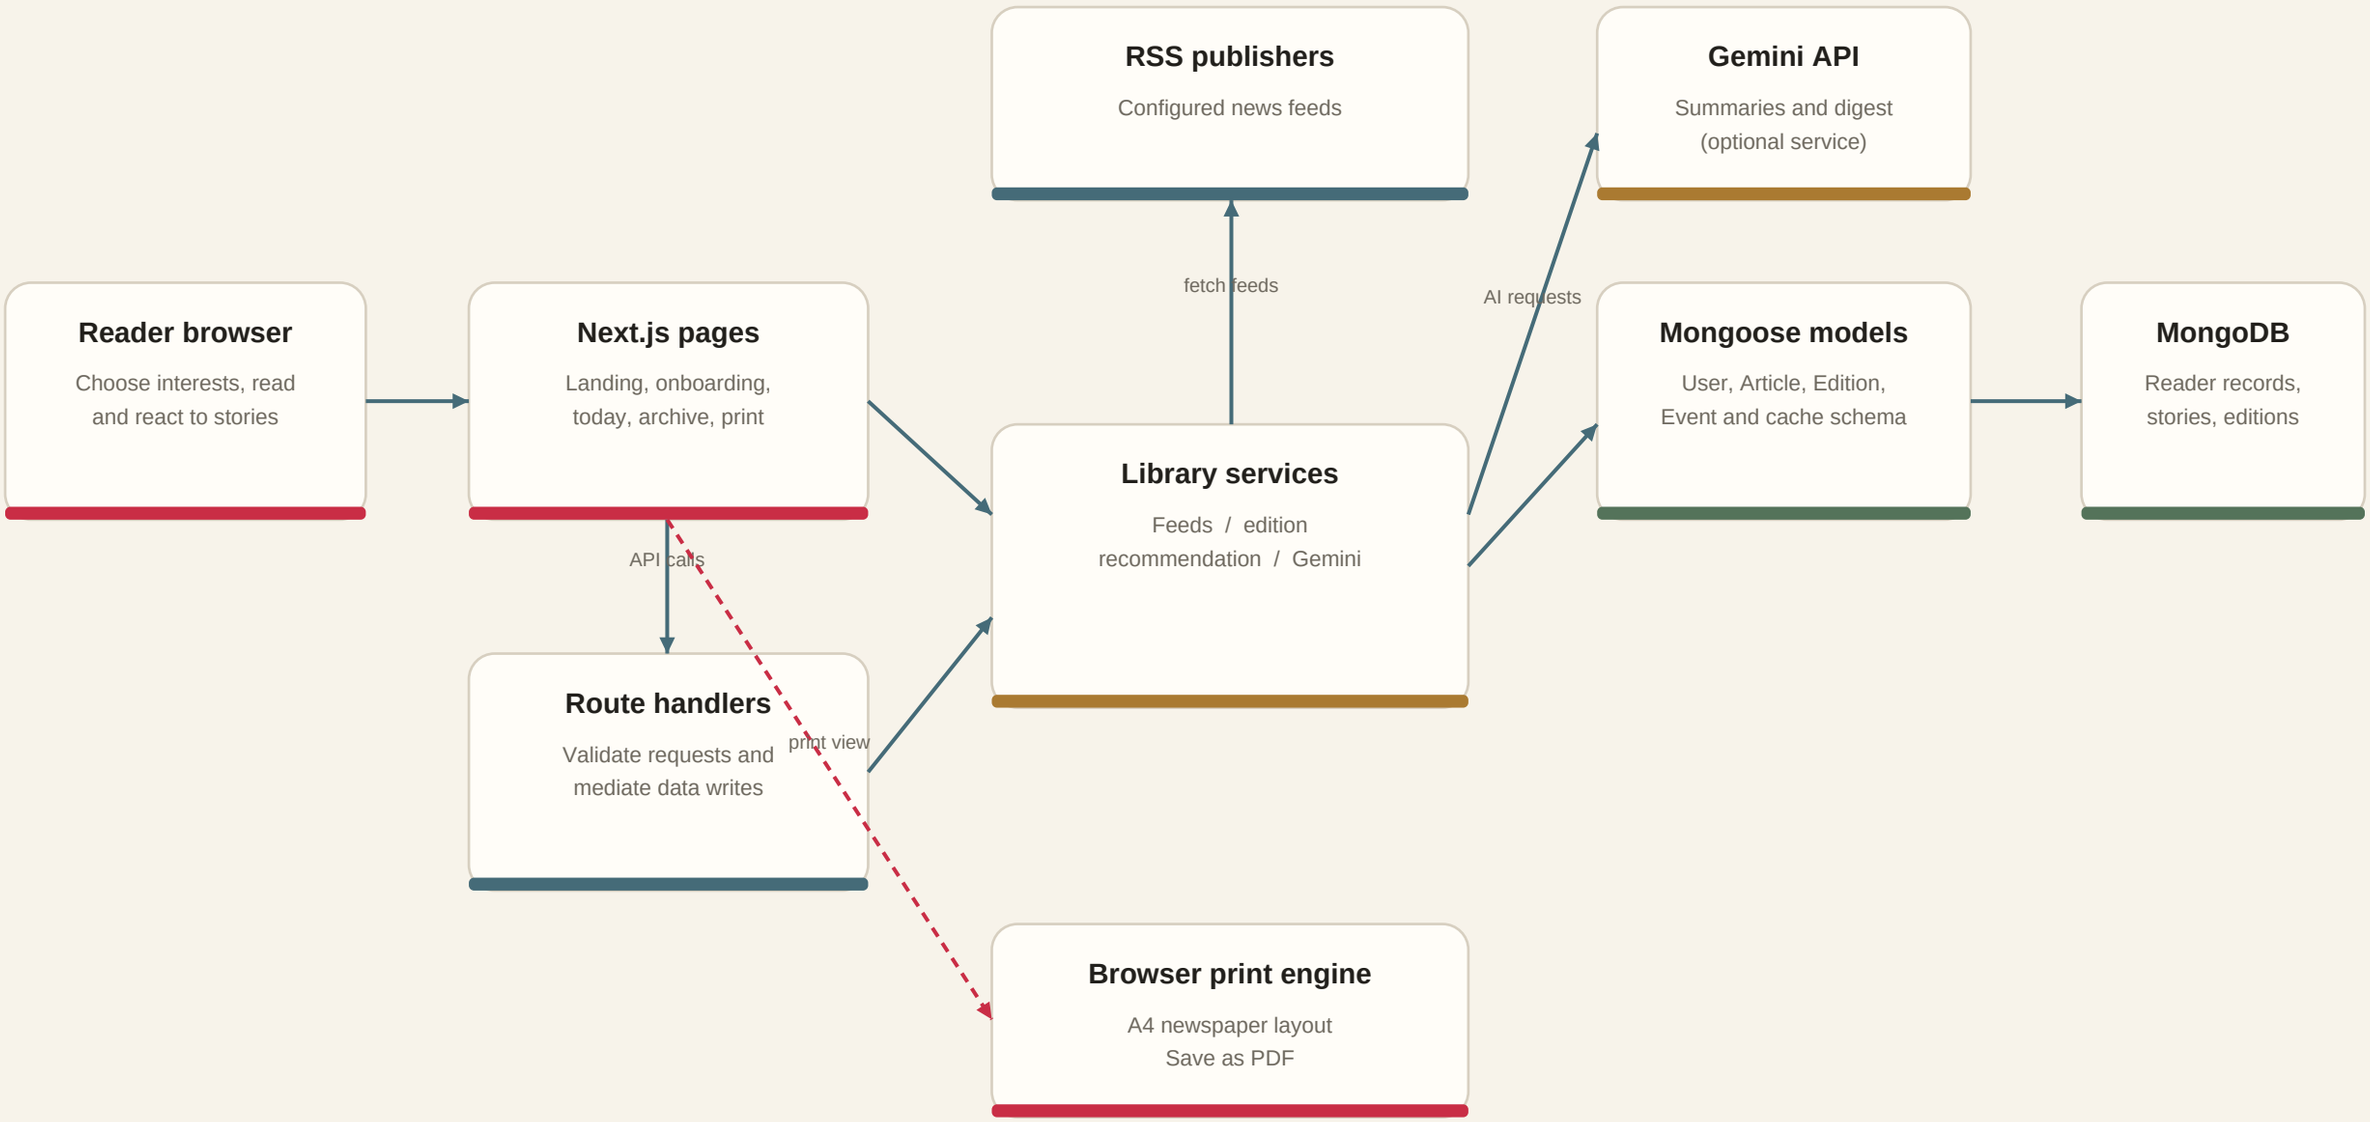
How Echo is built

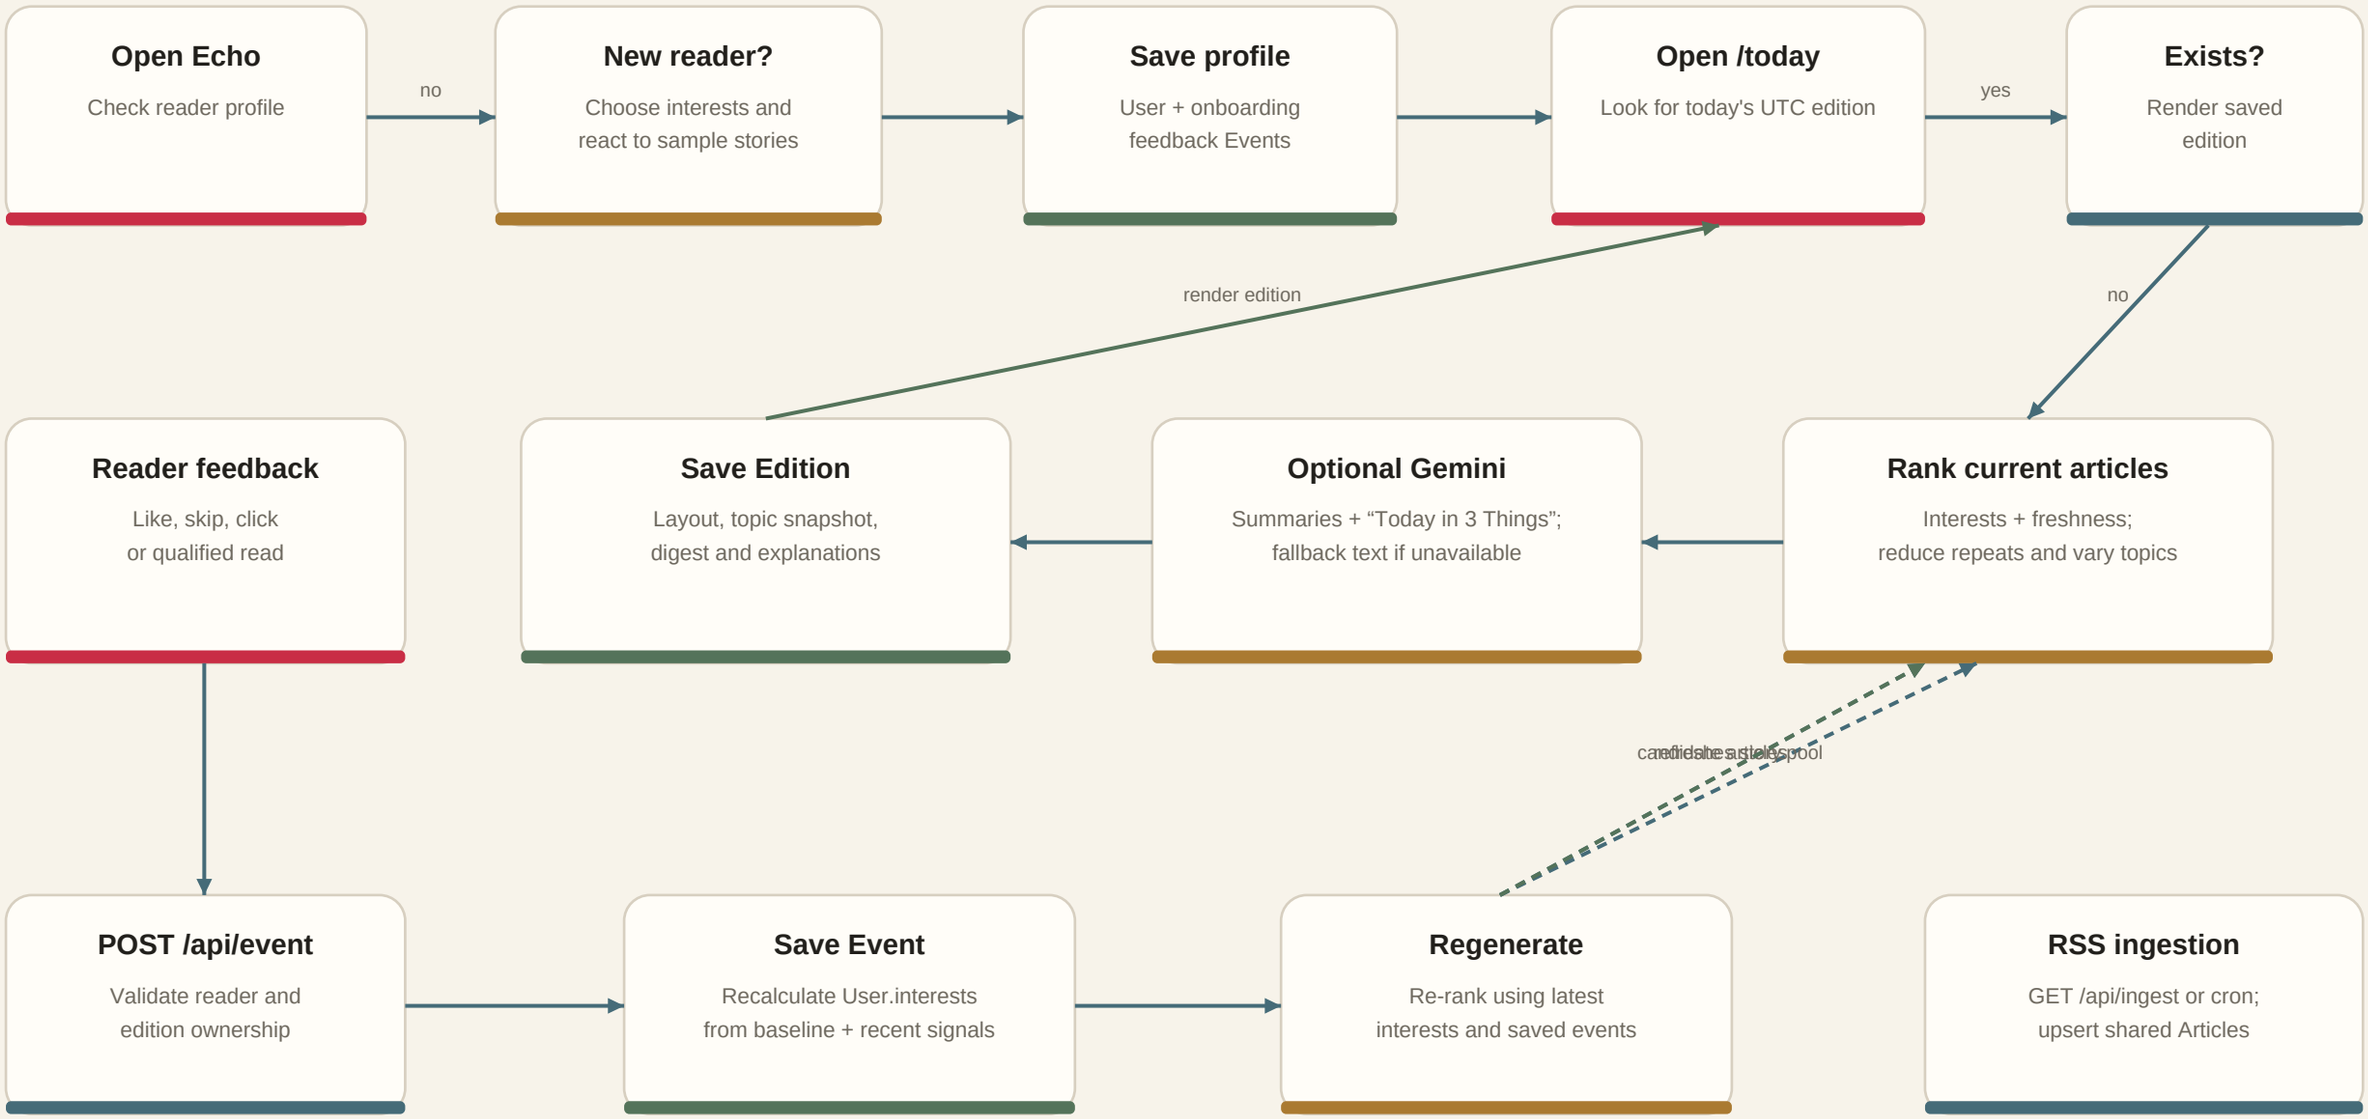
The request path from a reader to data, publishers, AI, and print.



Pages also call read-only library services; route handlers and services persist through Mongoose.

From first visit to a personalized edition

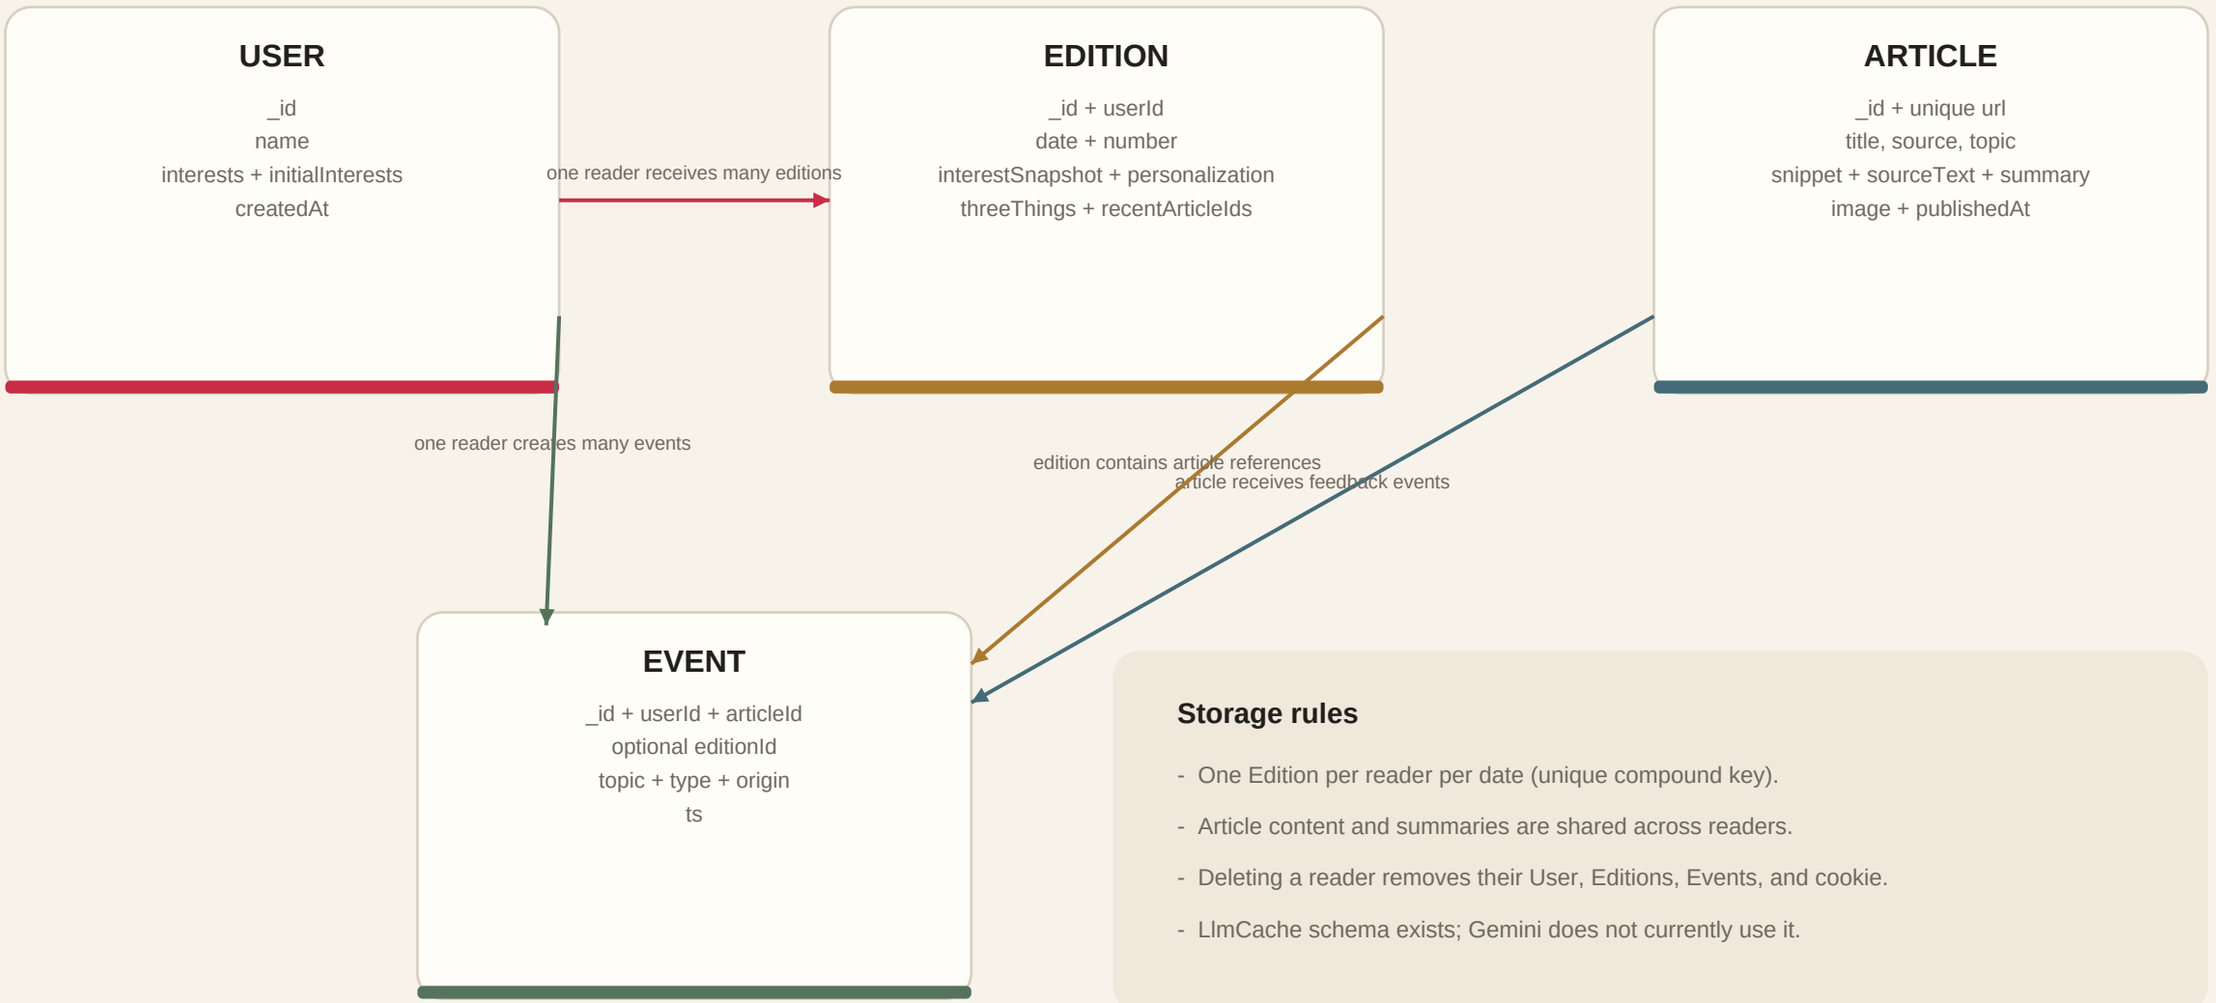
Article ingestion supplies the pool; reader activity improves later editions.



A reader’s first visit creates the day’s edition; a later visit reuses it unless the reader regenerates.

What Echo remembers

Reader-private records connect to a shared pool of publisher articles.



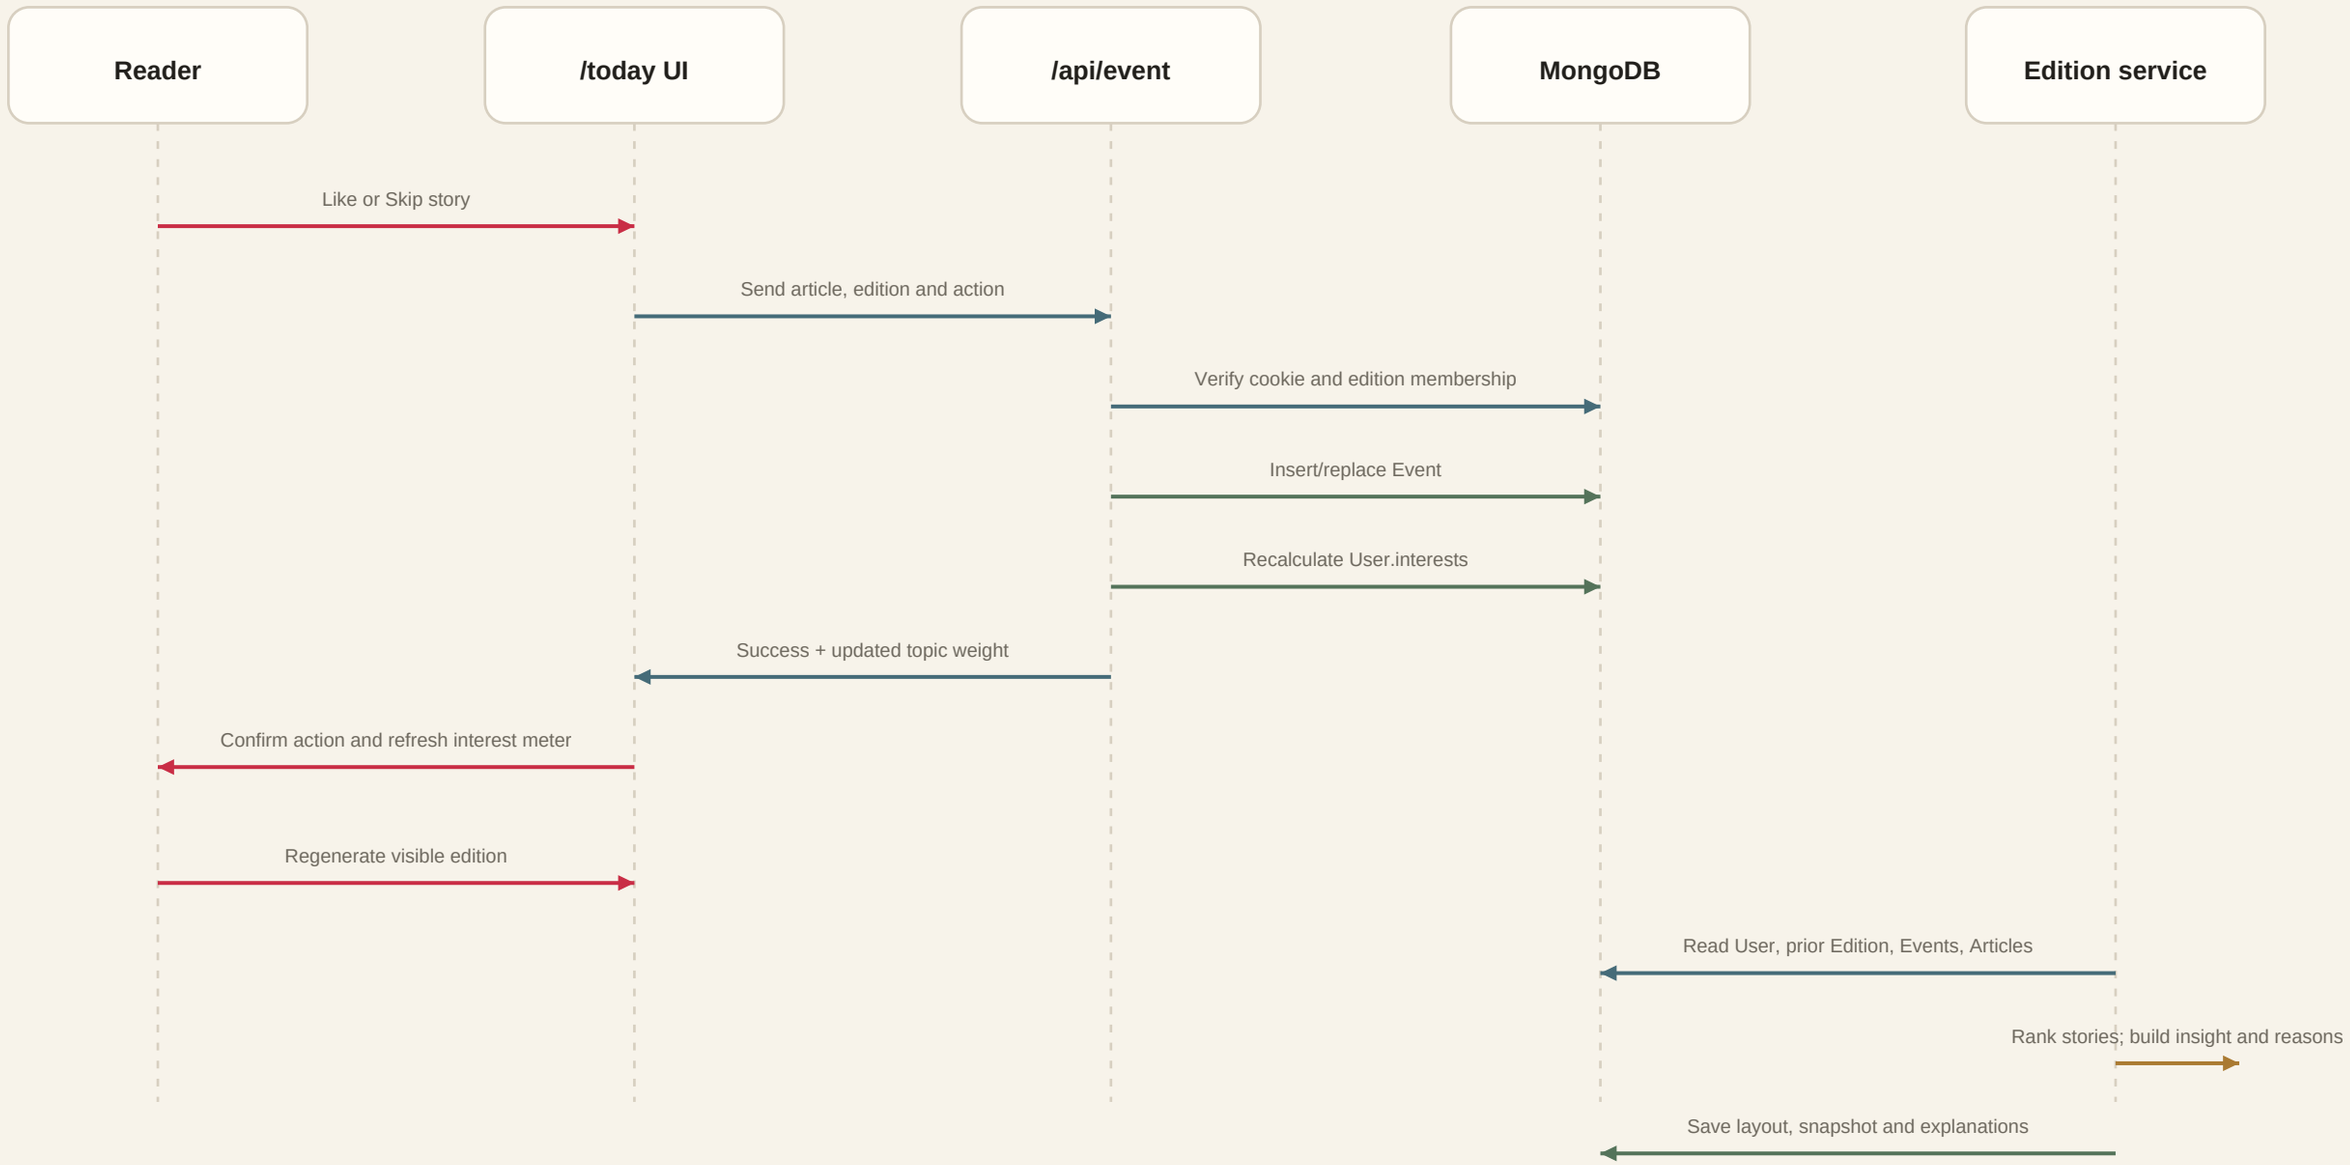
Storage rules

- One Edition per reader per date (unique compound key).
- Article content and summaries are shared across readers.
- Deleting a reader removes their User, Editions, Events, and cookie.
- LlmCache schema exists; Gemini does not currently use it.

An edition stores references and a snapshot, so the app can explain the recommendations it made.

Feedback changes the next edition

Saved actions update topic weights; regeneration uses those weights to select and explain stories.



Ranking score = topic weight + freshness x 0.12 + 0.025 for image + 0.015 for publisher excerpt
